

# ***Topsail***

The objective is to develop decision support aides for teams of intelligence analysts, and policy personnel to assist in anticipating and preempting terrorist threats to US interests. Goals are to develop automation, collaboration and cognitive aids technologies -- to make teams faster, smarter, and more joint in their day-to-day operations. These technologies will allow humans and machines to jointly reason together about complex problems, more efficiently and effectively. Intelligent software agents are expected to facilitate automation of tasks, cognitive amplification, creation of high performance teams, and the development of rich and accessible corporate memory.
